

## Effect of Feeding Spray-Dried Plasma in the Starter Diet at Different Doses and Duration in Broilers Undergoing a Severe Health Challenge

Volume 2, Issue 9

This study looked at the dosage and duration of feeding spray-dried plasma (SDP) to broilers. Reused litter was used in commercial broiler barns. For 0, 4, 7, or 10 days, SDP was fed at 0, 1, 1.8, 2, 3, 3.6 percent to broilers. All diets were similar throughout production. Low performance was observed due to illness and affected SDP intakes. Mortality was significantly lower in broilers fed SDP at any level compared to control broilers ( $P < .0001$ ).

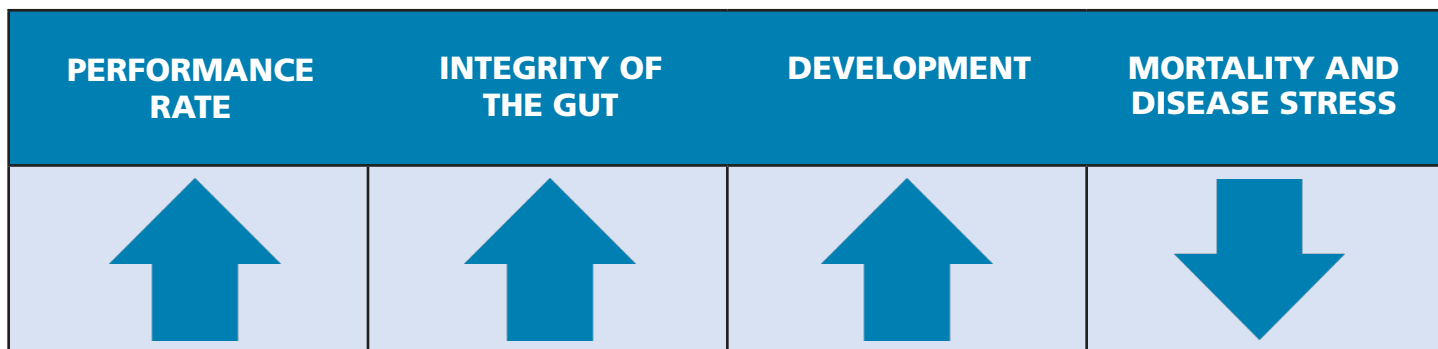

Body weight gain and feed index were significantly higher in broilers fed SDP ( $P < .0001$ ).

### Bottom Line:

- Feeding 1% for 10d has long lasting benefits under challenge
